ATV Safety

The use of ATV's has increased dramatically over the last ten years.

Most injuries associated with ATVs occur when:

- The driver loses control (When the operator encounters a change of terrain or swerves to avoid an obstacle, it causes an abrupt change of balance and loss of control.)
- The vehicle rolls over, The driver or passenger is thrown off, Or there is a collision with a fixed object
- The operator's loss of attention to what, where, and how an ATV is being operated

Identified contributing factors to ATV accidents include:

- Rider inexperience, Lack of helmet use, excessive speed--excessive speed, combined with rough terrain, can create enough pitch and bounce to cause the operator to lose control of the vehicle
- The ATV is improperly loaded or load weight exceeds vehicle operation capacity
- The operator carries a passenger that affects the operators control and operation of the ATV

Safety measures for ATV use include:

- Conduct pre-ride inspection-- This inspection should include checking tires, throttle cable, front and rear brakes, lights and switches, oil and fuel, chain or drive shaft, air filter, clean out of weeds and other debris from around engine and other hot components, and the chassis for any defects or wear.
- Single riders only--Injuries frequently occur to passengers, therefore riding double should not be permitted.
- Always wear - helmets, eye protection, and protective clothing. Appropriate helmets are those designed for motorcycle use, and should include safety visors/face shields, goggles, or safety glasses for eye protection.
- Use headlights to improve visibility by other vehicles, Traversing slopes should be avoided, Maintain speeds acceptable for riding conditions, especially over uneven terrain
- Mounted or towed loads should not exceed manufacturer's recommendation and should be properly mounted so that weight transfer does not affect the center of gravity of the machine--mounting a tank on the rear of the vehicle increases the chances for a rear turnover.
- Do not drive on public roads - Collisions with automobiles on public roads are the most common cause of fatal ATV accidents. It may be illegal to operate an ATV on public roads—check your state's law
